# Search

The search component allows to search for values manually.

Search component

The search input will apply a selection on your input based on the column you defined in the settings (3). If a match can be found on the column the selection is locked in:

1. Type in the search field and confirm with Enter.
   Users can enter any search query here. In the context of searching Activities, they might for example enter "Concurrency". Celonis 4 will now create a Selection, filtering all activities, whose name includes "Concurrency".
2. Settings: Define a placeholder text.
3. Settings: Set the dimension to search in.
