

# Source Configurations

The Source configuration screen allows you to specify the source systems for the authentication system and the user / group providers.

## Overview

The screenshot shows the 'System Settings' application with the 'Source configurations' tab selected. The page is titled 'Source configuration' and includes a descriptive text box. Below this, there are two main sections: 'LDAP SOURCES' and 'DATABASE SOURCES'. The 'LDAP SOURCES' section contains a table with one entry named 'CORP'. The 'DATABASE SOURCES' section contains a table with one entry named 'CH4'. To the right of these sections is a 'SOURCE CONFIGURATION' form with fields for Name, Database url, Database Username, Database Password, and Database driverclassname. Eight red numbered circles (1-8) are overlaid on the image to indicate key elements: 1 points to the 'LDAP SOURCES' header, 2 to the 'DATABASE SOURCES' header, 3 to the 'Add' button in the 'LDAP SOURCES' section, 4 to the 'Name' field, 5 to the 'Database url' field, 6 to the 'Database Username' field, 7 to the 'Database Password' field, and 8 to the 'Database driverclassname' field.

Here you can configure LDAP systems and database systems.

1. LDAP sources: list of connected LDAP sources. LDAP sources are used to manage user and group permissions.
2. Database sources: list of connected database sources.
3. Add: click on this button to add new LDAP or Database sources.

Source configuration:

4. Name: source name.
5. URL: url of the source.
6. Username: username to login into the database.
7. Password: password to login into the database.
8. Driver: class name of the database driver.
