Authentication

The Group Provider tab allows you to specify the user authentication.

Supported methods are LDAP and HTTP-Header. To use them, you have to configure User Providers and - if you want to use LDAP - a LDAP source.

Overview

Here you can configure the LDAP or database sources that define the user synchronization.

1. LDAP provider: list of connected LDAP provider.

2. HTTP header provider: list of connected http header providers.

3. Name: define your provider name.

4. Username attribute: define your username attribute.

5. LDAP source: defines the LDAP source from the list defined in the Source Configurations.

6. Userlist provider: defines the LDAP user provider from the list defined in the User Provider.
