

# Authentication

Here you can specify the user authentication.

Supported methods are LDAP and HTTP-Header. To use them, you have to configure [user providers](#) and - if you want to use LDAP - a [LDAP source](#).

Again, choose your desired provider on the left, click on  and fill out the displayed form.

LDAP PROVIDER	Add	AUTHENTICATION CONFIGURATION	Delete	Save
HTTP.HEADER PROVIDER	Add	<p>Name <input type="text" value="New LDAP Provider"/></p> <p>Username Attribute <input type="text" value="e.g. sAMAccountname"/></p> <p>LDAP source <input type="text" value="Select LDAP source"/> </p> <p>Userlist provider <input type="text" value="Select userlist provider"/> </p>		

Don't forget to save your configuration, use the [blocked URL](#).
