# User-/Group Provider

In these two tabs you can configure the user-/group providers if you want to use user-/group synchronization with other systems.

You can again choose between a **database table** and a **LDAP system** as source for the synchronisation process.

For both servers, you need to provide several columns, containing required user information:

> ✓ **Testing**
>
> You can test your database/LDAP connection before activating it.
>
> Fill out all fields and click on the [Test] button in the upper right corner.

Don't forget to save your settings with [Save] .
